SUMMARY

A results-driven, frontend-focused fullstack engineer with 15 years of experience leading small engineering teams within several industries including real estate, banking, and agricultural technology. Adept at delivering quality software on time, and with a focus on balancing the immediate needs of a product with the long-term needs of a company. Seeking an opportunity to lead or contribute to a small software engineering team to grow and deliver quality software, and to guide an engineering organization to success.

EXPERIENCE

Senior Software Engineer

EXCELERAS LLC (Chicago, Illinois) January 2023 – October 2024

- Created several features for a REO Servicing application that added business value to our real estate agent user's businesses, including an integration with a third-party vendor.
- Led development and agile user story organization of a small project to expand the reach of our Angular app to existing customers who were still using the older version of the application. Worked with stakeholders to allocate appropriate resources to the project to ensure it was completed on a tight timeline.
- Exercised professional communication skills to coordinate product, customer service, and quality assurance roles on developing, documenting and testing features I was developing. I often had to act as a project manager for my own features, as none was staffed within the company.
- Led efforts to upgrade the company's coding practices and developer experience, including promoting and teaching about Git version control (we used TFS), and promoting better code review practices (code reviews were not enforced).

Engineering Manager, Business Platform Team

AMOUNT (Chicago, Illinois) April 2021 – June 2022

- Led and mentored a team of four engineers, driving incremental improvements to the company's back-office suite of applications, including dispute and complaint processing, helpdesk tools, and user administration systems written in Node.js, React, Typescript and Express.js.
- Evaluated contract-to-hire engineers for our team, by setting performance expectations and directing their contributions to the team.
- Enhanced system performance by maintaining and modernizing applications with React frontends, Ruby on Rails backends, GraphQL APIs, and Node.js services over Postgres databases.
- Empowered engineers to expand their technical skill sets by guiding frontend developers into backend development with Ruby on Rails, fostering career growth and cross-functional expertise.
- Streamlined collaboration between engineering and business teams, ensuring more efficient feature releases by creating release notes and a system for creating those artifacts.
- Led a strategic initiative to tackle five years' worth of accumulated tech debt by maintaining a structured backlog, implementing best practices, and developing detailed technical documentation to improve onboarding and knowledge sharing.

Senior Associate Engineer, Avant Mobile Team

AMOUNT (Chicago, Illinois) May 2019 – April 2021

- Adapted quickly to a new tech stack, contributing production-level code within weeks despite having no prior experience with TypeScript, React, or GraphQL.
- Independently led and developed a critical feature enabling credit card payments for loan products on the mobile app, overcoming compliance challenges by designing a secure bypass around non-PCI-compliant systems.

Senior Technical Consultant

SOLSTICE (Chicago, Illinois) July 2013 – May 2019

Discover Financial Services - Discover Virtual Assistant

- Chatbot for customer questions backed by Google DialogFlow NLP and AI engine. Lead team in design and development of PCF SpringBoot app middleware for the bot.

Fifth Third Bank - Momentum

- Android and iOS app to help people pay down their student debt. Basically, Robinhood for student loans. Lead the development of the Android app from conception to version 1 release.

John Deere - MyOperations

- Operations monitoring app for farm managers, native Android and iOS. Lead team of four developers to develop and design both platforms from scratch. Created mocked API service to aid development when production APIs were delayed.

The Northern Trust - Private Passport

- Developed features and resolved bugs as an Android developer on a personal banking app. Implemented features including money transfer, photo-check-deposit, and push notifications.

Software Developer

SAFELITE AUTOGLASS (Columbus, Ohio) February 2010 – April 2013

- Mobile Blackberry/Android application ("MRM") for submitting paperwork for mobile service technicians. Featured push messaging, store-and-forward message reliability, secure credit card authorization, Bluetooth printer peripheral interfaces, smooth-stroke signature capture before those were commonly available in cloud systems! 4000+ users.
- Developed expansions to admin functions for the company's internal logistical tool, "MDM", which allowed dispatchers to plan technicians routes and equipment needs in advance.

EDUCATION

OHIO STATE UNIVERSITY, Columbus, Ohio

B.S., Electrical & Computer Engineering, 2010

SKILLS

Web: Angular, ASP.NET, React, GraphQL, Node.js, Nx, Webpack, Babel, Ruby on Rails, Express.js, Java SpringBoot

Mobile: React Native, Android, iOS

Languages: C#, Typescript, Javascript, Ruby, Java, Kotlin, Swift, VB, Bash

Cloud: Azure Devops, AWS - EC2, Route 53, IAM, Lambda, S3, Terraform

CI/CD: Docker, Buildkite, Jenkins, Github Actions

Databases: SQL Server, Postgres, Oracle

VCS: Git, Github, TFS

Architectures: Monoliths, Microservices, REST, SOAP, MVC

Middleware: Oauth, Okta

Workflows: Agile, Scrum, Basecamp, SAFe, Ad-hoc project management
